Title: Bruno, Giordano_Gatti, Hilary - Giordano Bruno_ Philosopher of the Renaissance (2017, Taylor and Francis Ltd _ Routledge) - libgen.li.pdf
Content Snippet:
I do not
mean to argue here, for example, that we must simply recategorize Bruno as a ‘Plotinian’ rather than a ‘Hermetic’ philosopher or magus. ⍰at would be a rather
fruitless intellectual exercise, and one whi⍰ would lay itself open to similar counter-
arguments about the privileging of

particular sources. What I do wish to say, is that the
Plotinian s□ema is locally significant in the De umbris idearum in a way that the
Hermetica are not, regardless of the significance Yates may have read into the
appearance of Hermes as interlocutor in the opening dialogue. Bruno, ironically enough, uses Hermes to voice his independence of any single philosophical tradition.
‘Let us not be like those thinkers’ he says,

who are limited to a determinate kind of foreign philosophy, nor let us disparage any way of philosophizing completely. We do not abolish the mysteries of the Pythagoreans, we do not beli□le the faith of the Platonists, nor do we scorn the reasonings of the peripatetics where they have a real basis.99

If a Platonic term or concept is apt then he uses it, if peripatetic terms

make expressing

something in the memory art easier, he adopts them.100 ere is not a single art, Bruno
says, whi meets all the needs of one person, and for those who wish to create works

of greater invention ‘the workshops of Aristotle and Plato alone will not suffice’.101

While he uses the conventional terms of other philosophers, he is not using them in the
customary sense, ‘we make use of the diverse studies of various philosophers in so far

as we are able to [use them to] insinuate themes of our own invention’,102 exercising
that subversive terminological dexterity whi Mi ele Ciliberto has so brilliantly

aracterized in the prefatory essay to his Lessico di Giordano Bruno.103

S olars are now beginning to rea a consensus regarding the need to stress

the
syncretic, eclectic and pluralist nature
of Brunian thought. There is less stress
on
grounding Bruno's philosophy in a single
philosophical outlook, but rather an
emphasis
on his diverse strategies of
intellectual filiation. Karen De León-
Jones, for instance, in
her recent book, Giordano Bruno and the
Kabbalah, sees Bruno as an 'example of
Renaissance syncretism at its most
extreme'. In reality, she says, 'Bruno
is Bruno; he
proselytizes his own philosophy'. De
León-Jones is correct, I believe, to
suggest that it is
reductive to 'limit the Nolan philosophy
by labelling it according to pre-
established
categories convenient to scholars of the
Renaissance such as "Hermeticist",
"Kabbalist"
or "Neoplatonist"'.104 Leen Spruit also
places particular emphasis on Bruno's

eclecticism, comparing his strategies (and their a endant problems) to those of that

other great Renaissance syncretist, Giovanni Pico della Mirandola.105 Spruit sees
Bruno’s ‘inventiveness’ and ‘liberty’ and ‘complicated contamination’ of philosophical

Content Snippet:
Leibniz’s sources here have been the subject of speculation. Bruno is an unlikely
source since Leibniz was not familiar with the relevant works as early as 1671. His use
of the term ‘Kern’ in the writings on the resurrection of the body of 1671 has been
linked with the monadological doctrine

of J.B. van Helmont and indirectly with that of

Augustine,85 according to whi God in the beginning sca ered the invisible seeds of
all things. Leibniz was content, mu later, to claim that his reasoning about all brute
souls being created at one time ‘agrees well with the Holy Scriptures, whi suggest

that there were seeds (semences) in the beginning’.86 But it is possible that his earlier
view derives from Augustine’s interpretation of Genesis, perhaps mediated by J.B. van

Helmont.87 It may be, then, that he was already disposed to hold that the ‘hidden seeds
of all things that are born corporeally and visibly are concealed in the corporeal
elements of this world’, the hidden seeds being created at the beginning by God

himself.88

Leibniz’s early theories of how the resurrection is possible are linked with his constantly repeated doctrine that there is something indestructible about all living things and that, strictly speaking, there is no su thing as death – nor, for that ma er, is there su a thing, strictly speaking, as birth. But though his views converge with those of Bruno at this point, I do not think they derived from his distinguished predecessor.

Conclusion

I have concentrated in this apter on aspects of Leibniz’s early monadology that are, I believe, common to the later philosophy. On many of the points where the later philosophy is at least ostensibly different, it is the younger Leibniz who is closer to

Bruno. He was closer to pantheism and determinism, indeed Spinozism, than he sought

to be and believed he succeeded in being in his mature philosophy.89 He was still

willing to defend, albeit residually, some form of atomism.90 Here are, as I have tried
to bring out, many points of similarity between the doctrines of the two philosophers.
The explanations for those similarities are various. Very little that I can discover is due

to the direct influence of Bruno. But Bruno was a contributory and indirect influence on
the young Leibniz both because of his influence on the Herborn school and because of
his influence on earlier Modern philosophers. Perhaps the most important explanation
for the similarities between Bruno and the young Leibniz, however, is due to their both

belonging to a common intellectual tradition, in whi ideas stemming ultimately from Pythagoras, Plato and Plotinus were taken for granted: ideas su as the perfection, harmony and plenitude of the world: ideas su as that a true being is simple and irreducible. Bruno anticipated the Moderns in a number of his preoccupations, as Leibniz saw it, with his revival of Democritus and his advocacy of an infinite universe, as well as his interest in the deeper mathematics. He no doubt influenced, at least to some extent, the intellectual culture of modern philosophy in these respects.

applicable to the De umbris idearum.’95

is seems to me directly to contradict the agential dimension of the De umbris with
its insistence on transformatio as the ultimate objective of the Plotinian programme. To
reduce the mnemonic works to an ‘epistemological problematic’ is to reduce the

complexity of the practices (logical, gnostic, religious and magical) whi they imply to
the level of mere theory. Compare, for example, his insistence in the Triginta Sigilli

that ‘art is not consummated in discourse’ but ‘perfects itself in the moment in whi it

is connected to a natural agent’,96 and his statement towards the end of his discussion
of magia where he says that by ‘the emulation of omnipotent nature’ (naturae

cunctipotentis aemula), magic can become its ‘director and governess’ (directrix et

gubernatrix).97 For Bruno, to understand the universe – whi was the aim of the mnemonic system – was to act upon it.

While Spruit, Rossi and Vasoli all give clearer-sighted accounts of Brunian mnemonics and its intellectual context than Yates, there are moments of overlap where

she does seem to be aware of Bruno's encyclopaedic theory of knowledge,98 but distorts these insights by diverting them into arguments about the talismanic annelling of astral influences, conjuration and the primary importance of Hermeticism, all of whi suffer from a la of textual evidence to support them.

Conclusions

In conclusion, I would like to suggest that the fruitful development of Brunian mnemonics aer Yates's pioneering speculations, have all indicated a need to take account of the profoundly eclectic nature of Bruno's philosophy as a synthesis. I do not mean to argue here, for example, that we must simply recategorize Bruno as a 'Plotinian' rather than a 'Hermetic' philosopher or magus. at would be a rather fruitless intellectual exercise, and one whi would lay itself open to similar counter-

arguments about the privileging of particular sources. What I do wish to say, is that the Plotinian s□ema is locally significant in the De umbris idearum in a way that the Hermetica are not, regardless of the significance Yates may have read into the appearance of Hermes as interlocutor in the opening dialogue. Bruno and Lull, as well as Cusanus, were mediated to Leibniz as part of a particular Platonist tradition carried forward by a
group known as the Herborn encyclopaedists. Some of the striking similarities between
Bruno and Leibniz are, I try to show, due to the fact that they belonged to this same

tradition and therefore not only shared some very important presuppositions but also drew some of the same conclusions from them. I consider, in particular, two assumptions that are important for both Bruno and Leibniz, as well as others in this tradition: first, that the universe, being the work of a perfect Creator, is itself perfect; and, second, that the world is composed fundamentally of indivisibles whi□ are therefore indestructible. □e first of these assumptions, whi□ I refer to as ‘the principle of perfection’, is full of implications for the nature of the world. In the fi□h section I look at the way in whi□ Leibniz developed the implications of the principle for the harmony of the universe, making comparisons with both Bruno and Cusanus. In the sixth section I consider the inferences Bruno and Leibniz drew from the

Principle of
Perfection for their views on plenitude and the infinite. Finally, I look at some of the
characteristics of their monads, in particular their view that there are fundamental
entities which underlie the transient world and which endure despite the constant
changes material things undergo.

It will be evident that I do not think there is a single answer to the question about
the connection between Bruno and Leibniz. There may be some direct influence of
Bruno on Leibniz. There is probably more indirect influence. But, as I argue, the main
reason for the similarities between the two philosophers is their debt to common sources and their membership of a common philosophical tradition.

The Debate about Bruno’s Influence on Leibniz

In the late nineteenth century many claims were made about Leibniz's sources and

Bruno was only one of several candidates7 whose claims to being a key influence on
Leibniz's philosophy were being canvassed by s olars. One of these was Hermann
Brunnhofer, who noted that many of Leibniz's distinctive monadological doctrines are

also to be found in Bruno.8 Brunnhofer was particularly concerned to show that Leibniz
derived his doctrine that monads have no windows from various casual remarks by Bruno.

Brunnhofer assumed, in his arguments, that Leibniz was thoroughly versed in Bruno's writings. is assumption was disputed by Ludwig Stein (1890). Against Brunnhofer, Stein argued that, prior to 1700, Leibniz's knowledge of Bruno was very
limited, confined to a book on Lull and

perhaps some of his mathematical writings.

Stein, I think, went too far the other way. But he was right to raise the question as to

However, just as Diana’s headlong □arges through the Forest of Ma□er represent only

partial enlightenment for Egidio da Viterbo, so the figure of Actaeon, even resurrected,

expresses only imperfect enlightenment for Giordano Bruno – as indeed he did for

Egidio in the ‘Caccia Bellissima dell’Amore’. The real transformation of the individual

from mortality to divinity takes place instead by a riverside, where in Egidio’s

Sententiae as in the Eroici Furori the baptismal sprinkling with divine waters presages

the mystical union with a transcendental beloved, described in both contexts in

language profoundly shaped by the Song of Songs. The river in Egidio’s Sententiae can

only be the Jordan. For the Nine Blind Men of the Eroici Furori it is the Thames, but it

is, of course, also the great river of Giordano’s eloquence.

What we definitely know about Giordano Bruno and Neoplatonism in Naples are the

following facts: that a very young Filippo Bruno went to learn logic from the

Augustinian friar Teofilo da Vairano, and that Teofilo's impact on his pupil went beyond

simple instruction in logic, that this hypercritical philosopher regarded Teofilo as 'his

greatest master in philosophy'. We know in addition that Bruno's own idea of

philosophy owed so profound a debt to Marsilio Ficino that he was accused of outright

plagiarism when be began to lecture at Oxford on a philosophy that Giordano himself

regarded as Nolan. ?e ri?est hoard of Ficinian texts in Naples was gathered in the

Seripando collection that formed a special jewel within the Augustinian library of San

Giovanni a Carbonara. We cannot as yet place Giordano Bruno firmly within that

library. Instead we must perform the same action that Marsilio Ficino develops from his

own readings of Plato: tra ing, vestigatio, looking for tell-tale traces that allow us to

re-create a more full idea about the real object of our pursuit.

And here the most striking traces are those le in Bruno’s writings on the one hand

and the writings of Egidio da Viterbo on the other. at Teofilo da Vairano was himself

a visionary Neoplatonist in the Ficinian mold cannot be established from his one

surviving treatise, De Gratia Novi Testamenti (On the Grace of the New Testament)
although there are tantalizing suggestions that he was a radical thinker in his own right.

 e parallels between Bruno and Egidio da Viterbo appear most pointedly in De umbris
idearum and in his Italian dialogues, especially the Eroici Furori, works in whi the

Nolan philosopher’s debt to Neoplatonism is particularly evident. The commanding influence of Marsilio Ficino, of course, was so clear that Giordano stood accused of plagiarism in Oxford. But there are also types of imagery that Ficino explored only superficially, whereas Egidio pursued them in depth, and so, in his turn, did the Nolan.

Perhaps the quality that most profoundly links Egidio da Viterbo to Giordano Bruno is the sheer ravening intensity of their quest for God, a quest they both gladly liken to

Frances Yates and the Making of Brunian Mnemonics

at an understanding of Giordano Bruno’s writings on the art of memory is essential
to an adequate understanding of his philosophical project is today considered

indisputable.1 That this is the case is largely due to the pioneering work of Frances Yates, who in The Art of Memory and Giordano Bruno and the Hermetic Tradition pursued a sustained and serious investigation of Brunian mnemonics which had, up to that point, received scant attention from intellectual historians despite the publication of Tocco's monumental edition of the Latin works in the 1880s.2 Yates made Brunian mnemonics a centrepiece of her influential study of the 'Hermetic tradition' in the Renaissance, arguing that Bruno had transformed the mnemotechnic theories of the pseudo-Ciceronian Ad Herennium, and the medieval tradition which arose from it, into a 'magical … Hermetic art', deriving directly from the Hermetic motif of 'reflecting the

universe in the mind'. 'It was now understood', she argued, 'as a method of printing basic or archetypal images on the memory, with the cosmic order itself as the "place" system, a kind of inner way of knowing the universe.'3

Developing an idea alluded to by Eugenio Garin, she argued that Bruno's first surviving work on the art of memory,4 De umbris idearum, published in Paris in 1582,5 was a magical memory art 'about a very strong solar magic' derived from Marsilio Ficino's De vita coelitus comparanda, although apparently 'making no direct quotations from it' and 'alluding' to it 'in a confused way'.6 Realizing that the long descriptions of astrological and mythological images given in the work were designed to be

used in
conjunction with the Lullist wheels,
Yates set about proving how these
figures were
functioning as talismans, that is to say
‘images designed to obtain universally

favourable influences’ from the
planets.7 In particular, she noted
Bruno’s selection of a
group of astrological images, including
the signs of the zodiac and ‘the images
of the
Egyptian decan demons’, taken directly
from Henricus Cornelius Agrippa’s De
occulta

philosophia.8

11.1 Handwri en dedication to Alexander
Dicson in Bruno’s first work on the art
of
memory, De umbris idearum, 1582.

Yates develops her reading of the De
umbris at greater length in her
subsequent

work The Art of Memory.9 Claiming now
that the work was ‘presented as a

religious

revelation’,10 and speculating on the possibility of a clandestine occult memory

tradition within the Dominican order,11 Yates placed stronger emphasis on Bruno’s

reliance on Agrippa for his ‘notoriously magical images’.12 ﬁe figures of the ‘very

powerful images of the decans of the zodiac’13 inscribed on the central band of the five

wheels are now seen as ‘the astral power station … whiﬁ works the whole system’,14

despite the fact that Bruno himself did not grant these images any particular importance. ﬁe images themselves are said to ‘express the planetary gods and their

influences aﬁer the manner of planetary talismans’,15 ‘harnessing the inner world of

it.78 e shadow is, in fact, an act of benevolence, or solicitude on the part of the
Divinity: ‘By means of the Shadow the Divinity tempers and offers the nuncial species

of things to the dim-sighted eye of the hungry and thirsty soul.’79

is benevolence of divinity towards mortals is mated by a gnostic elevation

of
the soul whi takes up this offer. To ascend to the One through the shadows of ideas, is
to transform and elevate the soul to a superior state; it is ‘raised above the height of

bodies into the proximity of the intelligences’.80 In discussing the various kinds of
a itude towards the sciences in Antiquity, Bruno notes that the peripatetic philosophy
based its beliefs upon undemonstrable things (de non demonstrabilibus), while the
Pythagoreans based theirs upon undemonstrated things (de non demonstratis). e

Platonists, he said, based their philosophy upon both of these kinds of principle.81 It is
perhaps in this light that we should view Bruno’s own philosophy: as a kind of Platonic
science (or scientia). us, while he

insists that ‘we must progress through a natural and rational course towards the explication of forms’,82 the final objective of this progress is to trace the analogical series of a ‘divine and natural order’ through the mind.83 An important model for Bruno’s ‘Platonic science’ at this point is Plotinus’s Enneades, as mediated by Marsilio Ficino’s In Plotini Enneades commentatio.84 ‘Plotinus understood’, Bruno says,

that the ladder through whi we rise to the principle is composed of seven steps (to whi we add two further steps); of these the first is the purgation of the soul, the second is a ention, the third intention, the fourth contemplation of order, the fi h the proportional comparison [of things] from [that] order, the sixth negation or separation, the

seventh prayer, the eighth the transformation of oneself into the thing, the ninth, the transformation of the thing into oneself.85

If one were looking for a philosophical ‘key’ to the De umbris idearum, it is surely to this passage that one would look. Rather than an ‘Egyptian revelation’, one would find a Plotinian magic – if one wishes to construe the ‘transformation of the thing into oneself’ as ‘magic’. The transformative power of imagination was a constant theme of Renaissance magic, and while Bruno’s system does not contain references to the talismanic instruments or conjurations referred to by Yates, it can still be construed as magical, albeit a Plotinian rather than a Hermetic magic. It was a magic which wedded

itself to the Lullian synthesis of logic and metaphysics, to pseudo-Ciceronian mnemote nics (appropriating the idea of the striking memory image to the metaphysical idea of a universal structure of analogous similitudes), to religious practices (purgation and prayer), and supported its claims with a wealth of subordinated (or mediating) references to the Cabbala, Pythagoreanism and Aristotelianism.

So, as Yates once asked, ‘How did the system work?’86 I would suggest that the Ars

CHAPTER ELEVEN

Simulacra et Signacula: Memory, Magic and

Metaphysics in Brunian Mnemonics*

Stephen Clucas

Frances Yates and the Making of Brunian Mnemonics

that an understanding of Giordano Bruno's writings on the art of memory is essential to an adequate understanding of his philosophical project is today considered indisputable.1 That this is the case is largely due to the pioneering work of Frances Yates, who in The Art of Memory and Giordano Bruno and the Hermetic Tradition pursued a sustained and serious investigation of Brunian mnemonics which had, up to that point, received scant attention from intellectual historians despite the publication of Tocco's monumental edition of the Latin works in the 1880s.2 Yates made Brunian mnemonics a centrepiece of her influential study of the 'Hermetic tradition' in the Renaissance, arguing that Bruno had transformed the mnemotechnic theories of the pseudo-

Ciceronian Ad Herennium, and the medieval tradition whi arose from it, into a ‘magical … Hermetic art’, deriving directly from the Hermetic motif of ‘reflecting the universe in the mind’. ‘It was now understood’, she argued, ‘as a method of printing basic or ar etypal images on the memory, with the cosmic order itself as the “place” system, a kind of inner way of knowing the universe.’3

Developing an idea alluded to by Eugenio Garin, she argued that Bruno’s first surviving work on the art of memory,4 De umbris idearum, published in Paris in 1582,5 was a magical memory art ‘about a very strong solar magic’ derived from Marsilio Ficino’s De vita coelitus comparanda, although apparently ‘making no direct quotations

Content Snippet:
Seripando collection that formed a special jewel within the Augustinian library of San

Giovanni a Carbonara. We cannot as yet place Giordano Bruno firmly within that

library. Instead we must perform the same action that Marsilio Ficino develops from his

own readings of Plato: tra ing, vestigatio, looking for tell-tale traces that allow us to

re-create a more full idea about the real object of our pursuit.

And here the most striking traces are those le in Bruno’s writings on the one hand

and the writings of Egidio da Viterbo on the other. at Teofilo da Vairano was himself

a visionary Neoplatonist in the Ficinian mold cannot be established from his one

surviving treatise, De Gratia Novi Testamenti (On the Grace of the New Testament)
although there are tantalizing suggestions that he was a radical thinker in his own right.

 e parallels between Bruno and Egidio da Viterbo appear most pointedly in De umbris
idearum and in his Italian dialogues, especially the Eroici Furori, works in whi the

Nolan philosopher’s debt to Neoplatonism is particularly evident. The commanding influence of Marsilio Ficino, of course, was so clear that Giordano stood accused of plagiarism in Oxford. But there are also types of imagery that Ficino explored only superficially, whereas Egidio pursued them in depth, and so, in his turn, did the Nolan.

Perhaps the quality that most profoundly links Egidio da Viterbo to Giordano Bruno is the sheer ravening intensity of their quest for God, a quest they both gladly liken to madness, to furor heroicus. Naples itself, with its natural wonders, its millennial history, and its pullulating street life, must have inflamed their thirst for God to truly heroic frenzy. These traces are perhaps shadowy and vestigial, but they nonetheless

suggest

something of the divine light shed upon generations of sensitive souls under that

‘benigno cielo’ of Campania.

CHAPTER FOUR

Giordano Bruno and Neapolitan Neoplatonism

Giordano Bruno entered Naples in 1562, at the age of 14. Three years later, at 17, he began his novitiate at the Dominican convent of San Domenico Maggiore, where he would eventually also enrol at the Dominican university in 1572, be ordained priest in 1573 and take a degree as lector in July of 1575.1 All told, Bruno would spend more than 14 years in Naples or its close environs before he fled northward in 1576. What he saw there, he saw as a young man; he left at the age of 28. Much of what he read in Naples he read with a student's eagerness or quick disgust. What he experienced there had the indelible vividness of formative experience, as we know from his Candelaio (1582), published in Paris at six years'

remove but unmistakably set amid the picaresque

street life of Naples. ﬁe mature writer of the 1580s must have differed significantly

from his younger Neapolitan self, but the grown man is all we now know of Giordano

Bruno.

Yet certain images that appear in his earlier writings and certain ways in whiﬁ he

structures his thought hark baﬁ to that vibrant, elusive Neapolitan world and to his

early studies with the teaﬁer who earned his highest praises rather than Bruno’s more

usual condemnation for asinine pedantry. Teofilo da Vairano was an Augustinian friar

from whom Bruno learned logic; he told his inquisitors in Venice that he had gone ‘a

sentire logica privatamente’, but he would tell the Parisian librarian Guillaume Cotin

that the Augustinian had been his ‘greatest master in philosophy’.2 ese lessons must

have taken place in the 1560s, when there was no guarantee that the bright young

Filippo Bruno da Nola would ever qualify for admission to the Dominican college at

San Domenico Maggiore, the most exclusive university in the whole kingdom of

Naples.3 Ea year only ten young men from the entire Regno were allowed to enter

San Domenico as ‘formal students’, most aer a period of preparation as what were

called ‘material students’. From the moment of their admission to formal status, they

would have three years to complete a rigorous course in academic theology, and to

earn the degree of lector – slower progress meant expulsion.4 Bruno himself would

first be admi ed as a formal student to the Dominican College at Andria in 1571, but

he ose instead to continue in Naples as a material student at the College of San

Domenico, where he finally obtained the coveted formal position in May of the

following year, 1572.

Content Snippet:
the imagination to the stars, or reproducing the celestial world within’.16 e planetary

‘influences’, Yates believed, were ‘imprinted on memory through magic images’,17 and
‘arranging or manipulating’ the images would allow the practitioner of the art to ‘act

on the inferior world, ﬁ ange the stellar influences on it’,18 the images were, in fact,

‘transmi ﬁ ers of … astral forces’.19 At another juncture, on a sudden inspiration, Yates declared that she was ‘inclined to think’ that the reason for Bruno’s ﬁ oice of divisions of 30 in his groups of images, had its source in Trithemius’ Steganographia ‘in whi ﬁ thirty-one spirits are listed with recipes for conjuring them’. ﬁ is leads directly to another speculation that Bruno’s lost mnemote ﬁ nical work, the Clavis Magna ‘might have explained how to use Lullian wheels as conjuring for summoning the spirits of the air’. His Lullian devices are, thus, seen as ‘“practical Cabala” or conjuring for rea ﬁ ing

the demons, or angels, beyond the stars’.20

Using her analysis of De umbris idearum as a foundation, Yates proceeded to judge Bruno's later mnemote□nical writings using the same yardsti□. □us she sees the Triginta Sigilli as an 'astrologized and magicized classical art of memory', whi□ was 'galvanized … through being affiliated to astral systems'.21 Bruno's art was to be used to 'get inside the astrological system';22 in this work 'the exercises in Hermetic mnemonics have become the spiritual exercises of a religion',23 'part of a Hermetic mystery cult'.24 She sees Bruno's final work, De imaginum, signorum et idearum compositione, as something of a departure in te□nical terms, especially in its 'elaboration of pseudo-mathematical, or "mathesistical", place systems'.25 Where

the
earlier mnemonic systems had capitalized
on the Lullian wheel, the De imaginum
focused on the ‘ar itectural memory
system’ whi was the mainstay of the
Pseudo-
Ciceronian memory art, although Yates
adds, ‘Bruno is using it in a highly
abnormal
way in whi the distribution of the
rooms is involved with magical geometry
and the
system is worked from above by celestial
me anics’.26 While she speculates
briefly on
the encyclopaedic nature of Bruno’s
memory art and the possibility that it
was a
‘memory code’ used by a secret
society,27 her primary theme is still
that Ficinian
talismanic magic is the basis of the
system.28
We will look more closely at Bruno’s
texts later, but a number of points are

worth
making now. First, Yates consistently de-emphasizes the diversity of Bruno's sources in

order to present his mnemonic works as Hermetic: 'Bruno's philosophy',29 Yates insisted, 'was the Hermetic philosophy'. Brushing aside views whi suggested that the

De umbris was 'some kind of Neoplatonic mysticism',30 or down-playing the influence

of Plotinus on that work (in whi Bruno refers to him as Platonicorum princeps)31 by
referring hastily to 'several mentions' of his name (as she does in the Hermetic

Content source: Source.file

Content Snippet:
Bruno, and to act as the youth’s ‘greatest master in philosophy’, that philosophy’s

Neoplatonic aspects must surely have been shaped by the leading Augustinian

exponent of Christian Neoplatonism, by Egidio da Viterbo in addition to Egidio’s own

inspiration, Marsilio Ficino. The possible traces of such influence in Naples are easy to spot, in manuscripts that come largely from the special reading room endowed by the Seripando family for the Augustinian congregation at San Giovanni a Carbonara.33 The originator of this library within a library was Girolamo Seripando himself; when he moved to Rome to take up his position as Prior General of the order, responsibility for the reading room passed to his brother Antonio. To this important collection, Teofilo da Vairano would certainly have had access. Filippo or Giordano Bruno may have as well.

Perhaps the most striking resemblance between Teofilo da Vairano and Egidio da Viterbo lies in their attitude towards the Jews: Egidio kept a rabbi in his

house to tea

him Hebrew and, like Teofilo a er him, a nowledged the validity of the Jews’

covenant with God. Both, to be sure, embraced their Jewish brethren as devout

Christians, convinced that the Messiah had already come to Judaea in the reigns of

Augustus and Tiberius Caesar, but they were respectful of their brethren in the faith –

and indeed of all others. Egidio prea ed Crusade by papal request, but he read Arabic

s olars. So did Teofilo da Vairano.

More elusive, yet more striking, are the parallels between Egidio da Viterbo and

Giordano Bruno. e Nolan’s encounter with philosophy occurred when he, with his

extraordinary memory and his brilliant visual imagination, was still a very young man,

at that time of life when both memory and sensory impressions are stimulated and

preserved with especial intensity, and critical faculties are in their infancy. Whatever

Egidio da Viterbo’s shortcomings as a philosopher may have been, and they were

many, his ability to create imagery in words, refined by his own immersion in the

classical art of memory, was an ability of the very highest order.34 He could give

imaginative form to philosophical abstractions with almost unparalleled success in his

own day, and this skill made his career as a prea er, as well as supplying definite

impetus to the development of the visual arts in sixteenth-century Italy.35 Like

Raphael’s exactly contemporary frescos in the pope’s private library, the School of

Athens, Parnassus, Disputa del Sacramento and Wall of Justice, Egidio da Viterbo could

transform ideas and words into human figures, or as Frances Yates said of the School of

Athens, into very gods.36

Ye Giordano Bruno we know from the early 1580s, the author of works ranging

from De umbris idearum, wri en in Paris in 1582, to De gli heroici furori, penned in

England three years later, owes an evident debt to Ficino for his Neoplatonic

formulations. Ye story of Bruno's alleged plagiarism of Ficino at Oxford in 1584 offers

telling proof of how closely the Nolan philosopher modelled his own thinking upon

Content source: Source.file

Content Snippet:
It will be evident that I do not think there is a single answer to the question about
the connection between Bruno and Leibniz. There may be some direct influence of
Bruno on Leibniz. There is probably more indirect influence. But, as I argue, the main
reason for the similarities between the

two philosophers is their debt to common sources and their membership of a common philosophical tradition.

The Debate about Bruno’s Influence on Leibniz

In the late nineteenth century many claims were made about Leibniz’s sources and

Bruno was only one of several candidates7 whose claims to being a key influence on
Leibniz’s philosophy were being canvassed by scholars. One of these was Hermann
Brunnhofer, who noted that many of Leibniz’s distinctive monadological doctrines are

also to be found in Bruno.8 Brunnhofer was particularly concerned to show that Leibniz
derived his doctrine that monads have no windows from various casual remarks by Bruno.

Brunnhofer assumed, in his arguments, that Leibniz was thoroughly versed in

Bruno’s writings. This assumption was disputed by Ludwig Stein (1890). Against Brunnhofer, Stein argued that, prior to 1700, Leibniz’s knowledge of Bruno was very
limited, confined to a book on Lull and perhaps some of his mathematical writings.
Stein, I think, went too far the other way. But he was right to raise the question as to

how much Leibniz actually knew of Bruno’s writings.9 Stein was struck by a blunder Leibniz made in letters to Lacroze and John Toland, in which his knowledge of Bruno
emerges as very limited indeed. This is particularly noticeable in a letter of April 1709,
to Toland, where he seems to be parading as much of his knowledge of Bruno as he can
muster:

I have at some time read the two works10 – one in Latin, the other in Italian – which Giordano Bruno has published on the

universe and the infinite. ey
show this author was not la ing in
penetration. But unhappily he went
beyond
the just limits of reason. He also went
in for the imeras of the art of Raymond
Lull. I have never read his Spaccio
della Bestia Trionfante. I have the
impression that someone spoke to me
about it once in France, but I cannot be
sure – it was a long time ago. Should
one not say Specchio rather than
Spaccio?
Mr Lacroze tells me that you have shown
him this book.11

is passage was taken by Stein, and has
been taken by a number of s olars since,
to

show that Leibniz was far from being
well versed in the writings of Bruno.12
And
Stein's arguments seem to have been
widely regarded as a refutation of the
claim that

Leibniz substantially derived his
monadology from Bruno.13 Robert La a,

for instance,

argued that Leibniz took li le more from Bruno than the name ‘monad’.14

ASSISTANT

Stephen Clucas, in his essay *"Simulacra et Signacula: Memory, Magic and Metaphysics in Brunian Mnemonics"* (in ***Giordano Bruno: Philosopher of the Renaissance***), reinterprets Bruno's *De umbris idearum* against Frances Yates's famous Hermetic reading. For Clucas, the decisive intellectual framework is not Hermetism but , mediated through Ficino's *In Plotini Enneades commentatio*.

Here are the key points Clucas makes about Plotinus's influence on Bruno:

- : Bruno explicitly cites Plotinus's doctrine of the soul's ascent to the One, describing a nine-step ladder (purgation, attention, intention, contemplation of order, proportional comparison, negation, prayer, transformation of oneself into the thing, and transformation of the thing into oneself). Clucas argues this is

the real “key” to *De umbris idearum*, not an “Egyptian revelation” as Yates proposed .

- :

  For Bruno, following Plotinus, the goal of the memory system was not epistemology alone but *transformatio*—the elevation and divinization of the soul. Clucas stresses that “art is not consummated in discourse” but perfects itself when united with a natural agent, and in this sense Bruno’s mnemonics were practical, active, and world-shaping .

- :

  Clucas distinguishes Bruno’s system as a “Plotinian magic,” not a Hermetic one. It integrates Lullian logic, pseudo-

Ciceronian mnemonic techniques, religious practices like purgation and prayer, and elements of Kabbalah, Pythagoreanism, and Aristotelianism—but the dominant structure is the Plotinian ascent .

- : Bruno used terms from various traditions—Platonic, Peripatetic, Pythagorean—but always refunctioned them for his own invention. Clucas highlights Bruno's declaration that one should not be bound by a single philosophical lineage, which ironically uses Hermes Trismegistus to voice independence from Hermetism itself .

- : Where Yates saw talismanic Hermetic astral magic in

Bruno’s mnemonic images, Clucas stresses the lack of textual evidence for such conjurations and insists instead on the Plotinian goal of inner ascent and transformation .

In short:

, with the ascent of the soul to unity with the divine as its true objective. This influence is more central than Hermeticism and sets Bruno’s mnemonics within a framework of Neoplatonic metaphysics and practice.

Do you want me to expand this into a

(with page-specific notes)?

USER

plotinian magic

ASSISTANT

Stephen Clucas uses the phrase to capture what is distinctive about Bruno's mnemonic philosophy. Here's how he frames it:

- : Frances Yates had read Bruno's memory images (especially in *De umbris idearum*) as a form of Hermetic astral-talismanic magic, where images are charged with planetary powers and act directly on the cosmos. Clucas argues this is misleading—there's no textual evidence that Bruno used talismans or invoked planetary spirits in his memory systems.

- : Instead, Clucas identifies the central structure as

. Bruno himself outlines a nine-step Plotinian ladder (purgation, attention, intention, contemplation of order, comparison, negation, prayer, transformation of self into the thing, transformation of the thing into self). This ladder, drawn from Ficino's Latin *Commentatio in Enneades*, governs Bruno's conception of what the art of memory is for.

- : In this sense, "magic" isn't talismanic manipulation of external forces but the *transformative ascent of the soul*. Bruno's memory art becomes a practical exercise for : the elevation of the intellect and imagination toward the One. The "magic" is the power of inner transformation and union, not of outward conjuration.

- : Bruno pulls together Lullian combinatorics, Ciceronian mnemonic techniques, prayer, purgation, even elements of Kabbalah and Pythagorean proportion—but Clucas stresses that the *unifying principle* is Plotinian. This makes Bruno's memory art an , not just a rhetorical aid or magical ritual.

- : For Clucas, then, Bruno's mnemonics represent a kind of "Plotinian magic," a practice where the imagination, disciplined by memory and images, participates in the metaphysical ascent toward unity with the divine. It is "magical" not because of talismanic operations but because it works on the

soul's transformation and identification with higher realities.

Would you like me to [illegible] in Clucas's account (with some explanation of how each stage functions as "magic")? That would show concretely how this ascent works in practice.

USER

rigorously scientific art of memory

ASSISTANT

Great question — this phrase [illegible] comes from Clucas's characterization of Bruno's mnemonics in contrast to both Hermetic magic and purely rhetorical memory traditions. Here's how he unpacks it:

- : The classical *ars memoriae* (from Cicero, Quintilian, and the *Ad Herennium*) was essentially a rhetorical technique—images placed in loci to help recall speeches. Bruno radicalizes this: for him, the art of memory isn't just about remembering words, but about structuring *all knowledge*.

- : Frances Yates thought Bruno's mnemonic images were magical sigils infused with astral or Hermetic power. Clucas argues against this, saying there's no textual evidence that Bruno built a system of talismanic correspondences or planetary invocations.

- : Instead, Bruno's mnemonic art is *rigorously scientific* because it seeks to:

- into one memory-machine (logic, physics, metaphysics, ethics).
- , so that memory isn't passive but an instrument of discovery (*inventio*).
- : images are arranged according to ordered schemes (wheels, houses, sigils), governed by principles of proportion, harmony, and necessity.

- : In Aristotelian and Neoplatonic terms, science (*scientia*) is knowledge of causes. Bruno thought his memory art was a way to ascend through the chain of causes, using imaginal structures to move from shadows of ideas up toward the One. This is why Clucas calls it

scientific: it is ordered, causal, and universal, not random or superstitious.

- : The rigor does not exclude transformation. For Bruno, the imagination disciplined by memory-images has real efficacy—it transforms the practitioner, aligns the soul with cosmic order, and participates in divine creativity. This is why Clucas calls it “Plotinian magic”: rigorous like science, but with the transformative and elevating power of Neoplatonic theurgy.

So, in Clucas’s account, Bruno’s *ars memoriae* is . It is rigorous because it is systematic, universal, and grounded in rational structures; magical because it

elevates and transforms the soul in a Plotinian sense.

Would you like me to make a

that contrasts:

1. Classical rhetorical memory,
2. Yates's Hermetic/talismanic memory,
3. Bruno's Plotinian "rigorously scientific" memory (per Clucas)?

USER

inventio

ASSISTANT

In Clucas's reading of Bruno, (invention/discovery) is absolutely central. He stresses that Bruno's art of memory is not just about storing and retrieving information but about

. Here's how it works in Clucas's framework:

- : In rhetoric, *inventio* was the first stage of composing a

speech—the finding of arguments. Memory (*memoria*) was usually the fourth stage, a tool for recall. Bruno collapses this distinction: for him, memory itself *is* a tool of invention.

- : Using Lullian combinatorics and his own mnemonic wheels, Bruno designed systems where images could be permuted and combined to reveal hidden connections. This turns memory into a , not a passive storehouse.

- : Because Bruno builds on Plotinus's ascent of the soul, *inventio* isn't only logical but also spiritual. By working with ordered images and correspondences, the

practitioner aligns imagination and intellect with the structure of reality, enabling genuine insight into causes and principles.

- : Clucas emphasizes that Bruno rejects passive forms of knowledge (tradition, rote learning). He declares that “art is not consummated in discourse” but must be united with a natural agent—that is, it must *act*. So memory becomes an *active practice* of inventio, fusing imagination with metaphysics.

- : This is part of what makes Bruno’s art of memory “rigorously scientific” (per Clucas). It is an *instrument of method*—like logic or mathematics—that allows the

philosopher to invent, discover, and ascend, rather than merely repeat what is already known.

So, in short:
For Bruno (as Clucas explains),

—the place where memory, imagination, and metaphysics meet to yield new insights. It transforms mnemonic technique into a universal method of discovery and spiritual ascent.

Would you like me to diagram how *inventio* works in Bruno's system—showing the flow from mnemonic images → combinations → insights → Plotinian ascent?

USER

what's the relationship between the art of memory as a tool for inventio and as a tool for plotinian magic or the transformation

ASSISTANT

Excellent — you've put your finger right on the hinge in Clucas's argument. The relationship between

and

is, in Bruno's system, *two sides of the same practice*. Here's how Clucas teases that out:

- : Bruno draws on Ramon Lull's combinatorial wheels and the rhetorical tradition of *inventio* to transform memory into a system for

  .

- : The mnemonic wheels and sigils are not random pictures but structured matrices. By rotating them, the practitioner

discovers , which counts as *inventio* in the classical sense.

- : This pushes beyond rhetoric into metaphysics—memory becomes a , capable of discovering truths about nature, being, and the cosmos.

- : Bruno embeds inventio within a Plotinian spiritual program: purgation, contemplation, negation, prayer, transformation of self into the thing, and transformation of the thing into self.

- : Working with memory images disciplines the imagination, allowing it to act as a . This practice isn't just cognitive—it *changes the soul*.

- : For Clucas, Bruno's art is "magical" because it is efficacious: it brings about union with higher realities. This isn't talismanic spell-casting but .

- : The combinatorial play of images (inventio) is not an end in itself but a method that conduces to the

Plotinian goal of transformation and ascent.

- :

- On the *cognitive/scientific* register, memory as inventio produces new knowledge and insights.
- On the *spiritual/magical* register, the same practice reshapes the practitioner's soul, raising it toward the One.

- : Clucas stresses that Bruno himself saw no opposition between these. The "scientific" rigour of his art ensured it could be transformative, while the "magical" transformation guaranteed that the discoveries were not just mental games but participation in real being.

So, the relationship is

:

- *Inventio* (discovery via images) is the instrument.

- *Plotinian magic* (ascent and transformation) is the telos.

Bruno's art of memory is thus simultaneously a and a

.

Would you like me to make a that shows how the two functions (inventio and transformation) integrate step by step in Bruno's memory system? That could make the relationship even clearer.

USER

tell me more about bruno's system and give that flowchart

ASSISTANT

Perfect — let’s dig deeper into Bruno’s *ars memoriae* as Clucas reconstructs it, then I’ll give you the flowchart.

Clucas emphasizes that Bruno's memory works are not just rhetorical manuals but ambitious

. They fuse classical mnemonics, Lullian combinatorics, and Plotinian metaphysics into a single method.

- : Bruno begins with the ancient technique of placing vivid images in imagined "houses" or loci.

- : He superimposes Lull's rotating figures, generating new pairings and triads of concepts.

- : Bruno's mnemonic systems are geometrically and

numerically ordered, often using 30, 150, or 1500 loci.

- By permuting images, Bruno's system *produces new combinations of concepts*.
- This allows philosophers not just to memorize but to between things—an *ars inveniendi*.
- Knowledge becomes *generative* rather than static.
- Bruno connects memory practice to (via Ficino):

- purgation → contemplation → negation → prayer → transformation.

- The imaginal discipline purifies and elevates the soul.

- Memory-images become , leading the practitioner toward union with the divine.

- The same practice of structured imaginal work yields :

- Cognitive: discovery of truths.
- Transformative: ascent of the soul.

- This is why Clucas calls Bruno's art a

  but also a kind of .

Here’s a conceptual map of how inventio and transformation integrate:

```
Ancient Mnemonics + Lullian Combinatorics +
Plotinian Ascent
                ↓
      Construction of Ordered Memory Systems
                ↓
     ┌──────────────────────────────┐
     │ Step 1: Place vivid images    │
     │ Step 2: Combine systematically│
     │ Step 3: Generate new relations│
     └──────────────────────────────┘
                ↓
           Inventio (Discovery)
      - New insights, logical relations
      - Knowledge of causes (scientia)
                ↓
    ┌──────────────────────────────┐
    │ Step 4: Contemplation          │
    │ Step 5: Negation & purification│
    │ Step 6: Prayer & transformation│
    └──────────────────────────────┘
                ↓
       Plotinian Magic (Ascent)
    - Soul elevated & divinized
    - Union with the One
                ↓
       Unified Brunian Ars Memoriae
    (Scientific instrument + Spiritual exercise)
```

So:

Its

rigor as a system of inventio is precisely what makes it effective as Plotinian magic.

Would you like me to also sketch how (which Clucas highlights) map onto the stages of mnemonic practice? That would give you a concrete “exercise manual” feel for how Bruno imagined the ascent.

USER

sure. and touch on any citation of specific plotinus texts along the way

ASSISTANT

Excellent — let’s map Bruno’s *ars memoriae* onto the he cites (through Ficino’s *In Plotini Enneades commentatio*). Clucas points out that this Plotinian ladder is central to understanding Bruno’s memory works like *De umbris idearum*.

Bruno lays out a nine-step ascent that comes directly from Plotinus (esp. *Enneads* I.6 [*On Beauty*], I.2 [*On Virtues*], VI.9 [*On the Good or the One*]) as transmitted by Ficino.

- *Plotinus*: The soul must cleanse itself of distractions and attachments (*Enn.* I.6.9).
- *Bruno*: Preparation of the mnemonic field — removing chaotic or trivial images, disciplining the imagination.
- *Plotinus*: The gaze of the soul must be focused inward (*Enn.* I.6.8).

- *Bruno*: Fixing attention on ordered images and loci, creating clarity and readiness.

- *Plotinus*: Directing the soul toward the intelligible realm (*Enn.* VI.9.3).

- *Bruno*: Orienting the combinatorial wheels toward meaningful relations, not arbitrary associations.

- *Plotinus*: Seeing the order and proportion of intelligible realities (*Enn.* I.6.2).

- *Bruno*: Recognizing proportional harmonies encoded in mnemonic figures — geometric and numerical order structures thought.

- *Plotinus*: Knowledge through analogy and proportion (*Enn.* V.8.4).

- *Bruno*: Using combinatory method to compare images, concepts, and proportions, discovering hidden correspondences (the essence of *inventio*).

- *Plotinus*: Ascending by stripping away multiplicity and affirmations (*Enn.* V.3.17).

- *Bruno*: Memory practice shifts from images-as-things to images-as-shadows — recognizing they are stepping stones, not ultimate truths.

- *Plotinus*: Prayer as an act of aligning with the One, not petition but inner turning (*Enn.* V.1.6).

- *Bruno*: The contemplative-mnemonic act becomes prayerful — an inner disposition, orienting imagination upward.

- *Plotinus*: The soul becomes what it contemplates (*Enn.* V.3.8).

- *Bruno*: The mnemonic practitioner identifies with the images, embodying the knowledge they encode.

- *Plotinus*: At the highest level, the One and the soul are united — no separation remains (*Enn.* VI.9.11).

- *Bruno*: The culmination of memory as Plotinian magic: images and realities dissolve, leaving the soul divinized, at one with the infinite.

Mnemonic discipline → Combinatorial *inventio* → Recognition of order/proportion → Negation and ascent → Union (Plotinian magic).

So:

- At the (contemplation, comparison, negation), Bruno's art of memory functions as a tool of .
- At the (prayer, transformation, union), the same practice becomes a form of .

- Bruno explicitly names Plotinus as a guide.

- Ficino's Latin commentaries on *Enneads* (esp. I.6 and VI.9) gave Bruno the language of ascent.

- This makes Bruno's art of memory a , not a Hermetic talismanic art.

👉 Would you like me to

(as Clucas cites it) so you can see the language he uses?

Frances Yates and the Making of Brunian Mnemonics

at an understanding of Giordano Bruno’s writings on the art of memory is essential
to an adequate understanding of his philosophical project is today considered

indisputable.1 That this is the case is largely due to the pioneering work of Frances Yates, who in The Art of Memory and Giordano Bruno and the Hermetic Tradition pursued a sustained and serious investigation of Brunian mnemonics which had, up to that point, received scant attention from intellectual historians despite the publication of Tocco's monumental edition of the Latin works in the 1880s.2 Yates made Brunian mnemonics a centrepiece of her influential study of the 'Hermetic tradition' in the Renaissance, arguing that Bruno had transformed the mnemotechnic theories of the pseudo-Ciceronian Ad Herennium, and the medieval tradition which arose from it, into a 'magical … Hermetic art', deriving directly from the Hermetic motif of 'reflecting the

universe in the mind'. 'It was now understood', she argued, 'as a method of printing basic or archetypal images on the memory, with the cosmic order itself as the "place" system, a kind of inner way of knowing the universe.'3

Developing an idea alluded to by Eugenio Garin, she argued that Bruno's first surviving work on the art of memory,4 De umbris idearum, published in Paris in 1582,5 was a magical memory art 'about a very strong solar magic' derived from Marsilio Ficino's De vita coelitus comparanda, although apparently 'making no direct quotations from it' and 'alluding' to it 'in a confused way'.6 Realizing that the long descriptions of astrological and mythological images given in the work were designed to be

used in
conjunction with the Lullist wheels,
Yates set about proving how these
figures were
functioning as talismans, that is to say
‘images designed to obtain universally

favourable influences’ from the
planets.7 In particular, she noted
Bruno’s selection of a
group of astrological images, including
the signs of the zodiac and ‘the images
of the
Egyptian decan demons’, taken directly
from Henricus Cornelius Agrippa’s De
occulta

philosophia.8

11.1 Handwri en dedication to Alexander
Dicson in Bruno’s first work on the art
of
memory, De umbris idearum, 1582.

Yates develops her reading of the De
umbris at greater length in her
subsequent

work The Art of Memory.9 Claiming now
that the work was ‘presented as a

religious

revelation’,10 and speculating on the possibility of a clandestine occult memory

tradition within the Dominican order,11 Yates placed stronger emphasis on Bruno’s

reliance on Agrippa for his ‘notoriously magical images’.12 ﬁe figures of the ‘very

powerful images of the decans of the zodiac’13 inscribed on the central band of the five

wheels are now seen as ‘the astral power station … whiﬁ works the whole system’,14

despite the fact that Bruno himself did not grant these images any particular importance. ﬁe images themselves are said to ‘express the planetary gods and their

influences aﬁer the manner of planetary talismans’,15 ‘harnessing the inner world of

whi may be labelled as Platonic and as rationalist. Either, metaphysics is being

described here as the way to the real and super-rational intuition of the eternal

principles of all being. Or – looking ba from the peak down to earth – metaphysics is

the (‘heroic’) realm of spiritual hermitage whi at best can communicate through

symbolic language (‘signi’) and eventually does not communicate at all.

I could easily continue at length with interpreting more or less popular quotations

from Bruno. What is sufficiently evident, I hope, is that we ought to read Bruno’s

philosophy as a highly differentiated discussion about philosophical theorems, and not

just as their unwarranted accumulation and proclamation. But to me even this is not

enough: Bruno is actually performing what modern philosophy ought to do – he is not

only a empting to justify philosophical doctrines, he is reflecting on the method of

philosophical justification and on the very possibility of philosophy. And I am

sure I am

not forcing Bruno’s texts but simply taking them seriously as a philosopher.

Notes

1 Regarding Bruno see my ‘Istoriar la figura: Theoriensynkretismus bei Frances A. Yates und Giordano Bruno als

philosophisches Modell’, in Zeitsprünge – Forschungen zur Frühen Neuzeit, 3, 1999, pp. 130–54.

2 For a detailed discussion of compatibilities and incompatibilities of Bruno’s thought with different phases of

modern science see Gatti, Hilary (1999), Giordano Bruno and Renaissance Science, Ithaca, NY: Cornell University

Press.

3 Petronijevic, Branislav (1904–12), Principien der Metaphysik, 2 vols, Heidelberg: Winter. The similarity of

Petronijevic’s metaphysics with Bruno has been claimed by Atanasijevic, Ksenia (1972), The Metaphysical and

Geometrical Doctrine of Bruno as Given in his Work De triplici minimo, St Louis, MS: Green. A er the many recent studies on Bruno's mathematics this thread seems to be worth taking up again.

magic of talismanic images of the stars. Bruno is transferring su operations

within, applying them to memory by using the celestial images as memory

images, as it were harnessing the inner world of the imagination to the stars, or

reproducing the celestial world within.20

However, a tendency to envision Bruno’s mnemote nics in a very different light has

recently developed, all of whi has led to a reassessment of the role played by the

Hermetic sphere.21 For example, Leen Spruit claims that Yates is wrong in applying

any magico-astrological mind set in interpreting the De umbris idearum as ‘the

hermetic tradition acquires primary importance only in the later works, in the ones,

that is, in whi his principal interest is directed toward operational problems’.22 Rita

Sturlese, in the introduction to her critical edition of the De umbris idearum, speaks of

Yates’s failure to provide an account of how Bruno’s memory system works. As a result

of the emphasis on the supposed magical correspondences, Sturlese continues, Yates

lost sight of the fact that Bruno’s mnemonic system had as its main intent that of

providing support for the human memory to receive, store and retrieve words in an

efficacious manner.23 In commenting on Bruno’s art of memory from within the

context of the De umbris idearum, Sturlese underlines the rigorously scientific nature of

Bruno’s system.24 Bruno does not make use of an iconic system, but rather one based

on ‘symbolic’ relationships, that is, where the symbols are not tied to any sort of fixed

relationship of similarity with their denotation (the primary meaning of a sign). Ⓡe

symbols, Sturlese writes, ‘originate from the infinite creativity of

ratio/phantasia and

acquire a significant function by virtue of being in a system that organizes symbols, that

is images, according to precise rules’.25 Sturlese emphasizes that by (1) operating

exclusively at the symbolic level of signification, (2) building images that lend

themselves to any sort of formation, (3) manipulating, combining and undertaking

mental experiments with signs, it is possible to uncover the infinite semiotic properties

of the syllables inscribed on the memory wheels found in the De umbris idearum.

Mu more recently, Hilary Gai has suggested that we need to look at the link

between art of memory and mathematics when dealing with Bruno. One of Gai’s

theses is that Bruno was at first mu interested in the art of memory; but his

interest

in the issue was greatly a enuated once he began working on the six Italian dialogues

of 1584–85 and the Frankfurt trilogy of 1591. However, he brought his writing career to

a close with the De imaginum, signorum et idearum compositione where the art of

memory recovers its lost centrality. To explain Bruno’s fluctuation in interest, Ga i

writes that:

in those intervening years Bruno was intent primarily on gauging the extent to

whi mathematics could or should be developed as the logical tool for an

inquiry into the newly infinite and atomic cosmos. When that path seemed to

lead him nowhere, Bruno returned to the traditional art of memory as possibly,

a er all, the most appropriate tool for investigating the shape and nature of

the

new universe.26

A key point in investigating the existence of possible links between Bruno and Vico is

PART ONE

Introduction

CHAPTER ONE

Giordano Bruno as Philosopher of the Renaissance

Giovanni Aquilecchia

While the title of my □apter – a title whi□ to a large extent coincides with that of the

conference itself – might at first sight seem quite unproblematic, on reflection it reveals

itself quite questionable from various angles. Unproblematic at first sight because the

philosopher in question does □ronologically belong to a period of European cultural

history whi□ since the nineteenth century has been included in a wider period

historiographically labelled as the Renaissance. Already at this factual □ronological

and descriptive level, however, marginal doubt could be raised. Although Giordano

Bruno’s life started in 1548 and ended in the year 1600, his extant works – the only

ones on whi we can base our judgement – date from 1582; and men of my

generation cannot forget that in the 30s and early 40s of the last century, when Italian

historians were busy suggesting a periodization for the literary and philosophical

Preface

Giordano Bruno has been depicted in many ways in the course of the four centuries which separate us from his tragic death, burnt as a heretic in the Campo dei

Fiori (e

Field of Flowers) in Rome on 17 February 1600. For some he has been a prophet of the

new science, who first supported and then extended to infinity the still suspect

Copernican, heliocentric astronomy; for others a practitioner of a vividly symbolic and

imaginative version of the classical art of memory; an inspiring or dangerous libertin

érudit, according to the point of view being proposed; or a metaphysician or mystic

with a ri talent for expressing his vision of God in complex and moving verse. More

recently he has been depicted as a Renaissance version of an ancient Egyptian or

Hermetic Magus, according to an influential reading proposed by the late Dame

Frances Yates.

Bruno, however, defined himself constantly and coherently as a philosopher: a

definition to whi he repeatedly resorted during his eight-year long trial at the hands

of first the Venetian and then the Roman Inquisition. For Bruno saw his trial as a

struggle for the right of the philosopher to follow a line of thought to its logical

conclusion, whatever objections might be put forward by the theologians. roughout

his trial, he declared his respect for a religion in whi he had participated as a

Dominican monk from 1565 to 1576, and then abandoned when he was found reading

forbidden books. For he was even more resolute in his respect for the right of the

enquiring, individual mind to follow, unimpeded, its sear for truth. His famous last

words in the public arena, warning his judges that they feared pronouncing his sentence

more than he feared receiving it, anticipate a time when the rights of the philosopher

De umbris was ‘some kind of Neoplatonic mysticism’,30 or down-playing the influence

of Plotinus on that work (in whi Bruno refers to him as Platonicorum princeps)31 by
referring hastily to ‘several mentions’ of his name (as she does in the Hermetic

Tradition),32 or simply ignoring him altogether (as she does in her

paraphrase of the
relevant sections in The Art of Memory),33 and by constantly linking his name rhetorically with things ‘Egyptian’ and ‘Hermetic’, Yates deliberately reconstructs Bruno’s syncretic philosopher as a ‘Hermetic magus’. In a significant critique of Yates’s single-minded concentration on the Hermetic philosophy in the Renaissance, Brian Copenhaver has drawn s olarly a ention to the broader set of texts available in the occult tradition, and to the relative la of importance of the Hermetica to many Renaissance thinkers, stressing the comparative centrality of Plotinus, Porphyry, Iambli us, Synesius and Proclus for Renaissance theories of magic.34 is diversity of the magical tradition is also evident in

Bruno’s mnemote□nical works despite Yates’s selective focus. Secondly, despite her insistence on the talismanic nature of Bruno’s memory images, and their role as ‘transmi□ers’ of astral powers, and her emphasis on the centrality of the decan images to his system, there is no direct textual evidence for su□ claims in Bruno’s theoretical statements, neither is there any evidence to support the view that he saw the function of his Lullist wheels as being connected with conjuration.

Rita Sturlese and the Undoing of Yates

It is precisely Yates’s desire to present Bruno’s mnemonics as the vehicle of a talismanic or magical Hermetic philosophy that became the focus of one of her most significant critics, Rita Sturlese. In a series of articles in the late 1980s and early

1990s, and in the
introduction to her 1991 edition of the
De umbris idearum, Sturlese argued that
Yates
had presented a seriously distorted view
of Bruno's mnemote□nical practices.
While
she applauded Yates for having given
serious a□ention to reconstructing the
'practico-
operative' parts of the Brunian memory
art whi□ had been ignored by previous
s□olars,35 Sturlese believes that
Yates's fundamental conception of the
system and of
its practical functioning is completely
erroneous.

Stressing the social usefulness of the
ars memorativa in Bruno's time, and the
ways
in whi□ it developed to meet the
exigencies of professional and
scientific
developments (especially the need to
learn extensive te□nical vocabularies in
areas

su as medicine, natural history, and civil and canon law),36 Sturlese argues persuasively that Bruno's memory art, rather than serving occult philosophical purposes, was developed for the purely practical purpose of memorizing words (memoria verborum). 'Is it possible', Sturlese asked, 'that the zodiacal images, rather than being arcane and archetypal images, a magical vehicle for communicating with the "superior agents" of the cosmos, are nothing other than one of the many artificial practices for effectively ordering objects for memorization?'37

is within us more than we ourselves are.29

us the Nolan – the new Astolfo – shows us how limited and relative our

perspective is; aer flying through the heavens to the moon he has discovered, like

Ariosto, that heaven is on earth and that the divine dwells within ea one of

us.

I have shown how Bruno used literary memory to construct around his own eulogy,

and around the new epic and mythic literary model whi he was seeking to create, a

gallery of figures that are linked to one another by a complex series of associations and

oppositions: Tiphys, Medea and Columbus on the one side, and Astolfo and Epicurus on

the other. At this point we may ask ourselves whether, in this innovative and highly

unconventional use of literary tradition, we may not also find elements linked to the art

of memory. If we recall that, as traditionally practised, the te niques of memory were

closely concerned with inventio, and that the ars memoriae in fact served as an

```
interface between the act of reading and
the act of writing, we can imagine that
in his

text Bruno was

Frances Yates and the Making of Brunian Mnemonics

at an understanding of Giordano Bruno’s writings on the art of memory is essential
to an adequate understanding of his philosophical project is today considered

indisputable.1 That this is the case is largely due to the pioneering work of Frances Yates, who in The Art of Memory and Giordano Bruno and the Hermetic Tradition pursued a sustained and serious investigation of Brunian mnemonics which had, up to that point, received scant attention from intellectual historians despite the publication of Tocco's monumental edition of the Latin works in the 1880s.2 Yates made Brunian mnemonics a centrepiece of her influential study of the 'Hermetic tradition' in the Renaissance, arguing that Bruno had transformed the mnemotechnic theories of the pseudo-Ciceronian Ad Herennium, and the medieval tradition which arose from it, into a 'magical … Hermetic art', deriving directly from the Hermetic motif of 'reflecting the

universe in the mind'. 'It was now understood', she argued, 'as a method of printing basic or archetypal images on the memory, with the cosmic order itself as the "place" system, a kind of inner way of knowing the universe.'3

Developing an idea alluded to by Eugenio Garin, she argued that Bruno's first surviving work on the art of memory,4 De umbris idearum, published in Paris in 1582,5 was a magical memory art 'about a very strong solar magic' derived from Marsilio Ficino's De vita coelitus comparanda, although apparently 'making no direct quotations from it' and 'alluding' to it 'in a confused way'.6 Realizing that the long descriptions of astrological and mythological images given in the work were designed to be

used in
conjunction with the Lullist wheels,
Yates set about proving how these
figures were
functioning as talismans, that is to say
‘images designed to obtain universally

favourable influences’ from the
planets.7 In particular, she noted
Bruno’s selection of a
group of astrological images, including
the signs of the zodiac and ‘the images
of the
Egyptian decan demons’, taken directly
from Henricus Cornelius Agrippa’s De
occulta

philosophia.8

11.1 Handwri en dedication to Alexander
Dicson in Bruno’s first work on the art
of
memory, De umbris idearum, 1582.

Yates develops her reading of the De
umbris at greater length in her
subsequent

work The Art of Memory.9 Claiming now
that the work was ‘presented as a

religious

revelation’,10 and speculating on the possibility of a clandestine occult memory

tradition within the Dominican order,11 Yates placed stronger emphasis on Bruno’s

reliance on Agrippa for his ‘notoriously magical images’.12 ﬁe figures of the ‘very

powerful images of the decans of the zodiac’13 inscribed on the central band of the five

wheels are now seen as ‘the astral power station … whiﬁ works the whole system’,14

despite the fact that Bruno himself did not grant these images any particular importance. ﬁe images themselves are said to ‘express the planetary gods and their

influences aﬁer the manner of planetary talismans’,15 ‘harnessing the inner world of

Content Snippet:
Bruno develops some startling fantasies based on the idea of metempsy□osis. He

later repudiated this work as having been misunderstood by his readers. □anks

are due to the Library of University College London for permission to publish this

photograph, taken from a book held by their Rare Books Library.

13.1 Frontispiece of Giordano Bruno, De triplici minimo, the first work of the so-called

Frankfurt Trilogy, published in that town in 1591, and by many considered Bruno’s

philosophical masterpiece. Thanks are due to the Library of University College

London for permission to publish this photograph, taken from a book held by their

Rare Books Library.

14.1 Title page of Bruno’s Explicatio triginta sigillorum, in his Ars reminiscendi, 1583.

Thanks are due to the British Library for permission to publish this image.

15.1 The 12 houses of memory in Bruno’s De umbris idearum, his first work on the art

of memory published in Paris, 1582. Thanks are due to the Library of University

College London for permission to publish this photograph, taken from a book held

by their Rare Books Library.

16.1 Frontispiece of Oceanus macro-microcosmicus (1664) by Sa□s A. Lowenheimb.

□anks are due to the Wellcome Library, London, for permission to publish this

photograph.

17.1 Frontispiece to the book on the Principles of Measure and Figure in Bruno’s De

triplici minimo, Frankfurt, 1591, where he explains his Pythagorean monadology.

□anks are due to the Library of University College London for permission to

publish this photograph, taken from a book held by their Rare Books Library.

18.1 A celebrated page of the first book of Bruno’s De triplici minimo, Frankfurt, 1591,

where he repudiates any passive form of knowledge gained through tradition or

unquestioning dogma, and places the inquiring reason of the philosopher at the

centre of the quest for truth. Thanks are due to the Library of University College

London for permission to publish this photograph, taken from a book held by their

Rare Books Library.

Content Snippet:
divinum vestigium, media quandam cognitione divina cognoscimus.’

47 Vat. Lat. 6325, 39v: ‘si vestigium idea non est, sed extra ideam iacet; quicquid autem extra ideam iacet, aut umbra ideae est, et formae, aut umbrae subiectum, ac materia, quae et in Timaeo parens, ac proles, in Philebo,

infinitum, et terminus nominantur potestas, quare cum duo tantum sint,

extra ideam duae tamen videbuntur partes

esse.’

48 See, for example, Vat. Lat. 6325, 111v: ‘mens humana, quae quanquam clausa in tenebris carcere caeco iaceat

… ’61r. ‘Principium unde omnia formam sumunt, sola idea est, ut Timeus, a quo et pulcrum, et forma proficiscitur;

at idea et sol, et lux est, ex 6 reip., alia vero vel umbrae, vel tenebrae. Tenebrae materia, et sylva, ubi nihil est lucis

umbrae sunt formae, quae participata quamdam, et malignum, ut Maro ait, in silvis ferunt lucem, quae materiae

comparatae lux dicitur. Si ad ideas referantur, et tenebrae nominari possunt: se vero quatenus extremi utriusque

mediae sunt considerentur, non lux, non tenebras, sed umbrae nominantur.’

49 Bruno, Giordano [1582] (1991), De umbris idearum, ed. Rita Sturlese, Florence: Leo S. Ols□ki, p. 26 (Intentio

Secunda. B.): ‘Non est umbra tenebrae, sed vel tenebrarum vestigium in lumine, vel luminis vestigium in tenebris, vel

particeps lucis et tenebrae … ’; 36 (Intentio XV. P): ‘Neque enim natura patitur immediatum progressum ab uno

extraemorum ad alterum, sed umbris mediantibus … ’.

50 Marsilio Ficino and Giovanni Cavalcanti, Le er to Giorgio Antonio Vespucci, in Ficino, Marsilio (1959), Opera
Omnia, Turin: Bo ega d’ Erasmo, vol. I.II., p. 631: ‘Fortunatus nimium venator, qui solis Solem passim sibi

sectandum totis viribus proposuerit. Nempe prius etiam quaerat, hunc facillime reperit, quem non nisi eiusdem

calore accensus quaesivit.’

51 See, for example, Livy, Ab Urbe Condita, IX.36: [36] ‘Silua erat Ciminia magis tum inuia atque horrenda

quam nuper fuere Germanici saltus, nulli ad eam diem ne mercatorum quidem adita. Eam intrare haud fere

quisquam praeter ducem ipsum [sc. Quintus Fabius Maximus] audebat; aliis omnibus cladis Caudinae nondum memoria aboleuerat.’

Content Snippet:
metaphysics, physics and logic, or the praeternatural, the natural and the rational admit a certain analogy, that is, the True, the Image and the Shadow. On the other hand the idea in the divine mind exists in the complete and single act simultaneously. The ideas are in the intelligences as discrete acts. In the heavens, they are manifold and successive in active power. In nature,

by means
of the vestiges, as if by impression,
and in the intention and reason they are
present by means of the shadow.77

If the process of tracing species ba to
their originating ideas by means of
their
intermediary shadows is both logical and
metaphysical, it is also religious. In
discussing
the gradatim progression of the mind
through the hierar y of similitudes in
the
universe, Bruno notes that this method
is made necessary because of the nature
of
divinity. Comparing the intermediary
shadows to Cabbalistic interpretations
of the veil
whi Moses wore a er having spoken to
God in Exodus 33:34, whi protected his
people's eyes from the damaging light of
divinity, Bruno says that man cannot
move
suddenly from the darkness of the
material world to the light of the One,

because
‘Nature will not allow immediate
progress from one extreme to the other,
but only
through intermediary shadows’. ﬁe shadow
‘prepares the sight for light’ and
‘tempers’

it.78 ﬁe shadow is, in fact, an act of
benevolence, or solicitude on the part
of the
Divinity: ‘By means of the Shadow the
Divinity tempers and offers the nuncial
species

of things to the dim-sighted eye of the
hungry and thirsty soul.’79

ﬁis benevolence of divinity towards
mortals is matﬁed by a gnostic elevation
of
the soul whiﬁ takes up this offer. To
ascend to the One through the shadows of
ideas, is
to transform and elevate the soul to a
superior state; it is ‘raised above the
height of

bodies into the proximity of the
intelligences’.80 In discussing the

various kinds of
a□itude towards the sciences in
Antiquity, Bruno notes that the
peripatetic philosophy
based its beliefs upon undemonstrable
things (de non demonstrabilibus), while
the
Pythagoreans based theirs upon
undemonstrated things (de non
demonstratis). □e

Platonists, he said, based their
philosophy upon both of these kinds of
principle.81 It is
perhaps in this light that we should
view Bruno's own philosophy: as a kind
of Platonic
science (or scientia). □us, while he
insists that 'we must progress through a
natural and

rational course towards the explication
of forms',82 the final objective of this
progress

is to trace the analogical series of a
'divine and natural order' through the
mind.83 An
important model for Bruno's 'Platonic

science’ at this point is Plotinus’s Enneades, as

mediated by Marsilio Ficino’s In Plotini Enneades commentatio.84 ‘Plotinus understood’, Bruno says,

viam aperit et introducit.’

49 Ibid., p. lxxii.

50 Ibid., p. lxxiii.

51 Sturlese, ‘Interpretazione’, p. 964: ‘[C]redo si possa parlare di una modernità e anche contemporaneità di Bruno, che consiste nell’aver intuito che una scienza della natura non può prescindere da un sistema di simboli. Il suo limite è nell’ aver concepito questi

simboli so□o forma di immagini: e in tal modo si sbarrò la strada ad una costruzione matematicoscientifica della natura.’ □e arbitrariness of signs in Bruno’s system, however, is not arbitrary in the modern sense of ‘indifferent denotation’, but arbitrary out of a sense of the metaphysical interconnectedness of the universe. If everything can □ange into everything else, than anything can stand for anything else. It is an arbitrary symbolism based on a metaphysical premise: that of the immanent unity of the
three worlds, not on any sense of the symbol as an indifferent algebraic operator. □e signs, as Bruno keeps suggesting, are adapted to their purpose, that is, there is a link (a similitude, or analogy, perhaps) between the image
and the thing signified, whi□ makes it effective. □is link would doubtless become more important in the ‘higher and more general’ form of the art.

it.78 e shadow is, in fact, an act of benevolence, or solicitude on the part of the
Divinity: ‘By means of the Shadow the Divinity tempers and offers the nuncial species

of things to the dim-sighted eye of the hungry and thirsty soul.’79

is benevolence of divinity towards mortals is mated by a gnostic elevation

of
the soul whi takes up this offer. To ascend to the One through the shadows of ideas, is
to transform and elevate the soul to a superior state; it is ‘raised above the height of

bodies into the proximity of the intelligences’.80 In discussing the various kinds of
a itude towards the sciences in Antiquity, Bruno notes that the peripatetic philosophy
based its beliefs upon undemonstrable things (de non demonstrabilibus), while the
Pythagoreans based theirs upon undemonstrated things (de non demonstratis). e

Platonists, he said, based their philosophy upon both of these kinds of principle.81 It is
perhaps in this light that we should view Bruno’s own philosophy: as a kind of Platonic
science (or scientia). us, while he

insists that ‘we must progress through a natural and rational course towards the explication of forms’,82 the final objective of this progress is to trace the analogical series of a ‘divine and natural order’ through the mind.83 An important model for Bruno’s ‘Platonic science’ at this point is Plotinus’s Enneades, as mediated by Marsilio Ficino’s In Plotini Enneades commentatio.84 ‘Plotinus understood’, Bruno says,

that the ladder through whi we rise to the principle is composed of seven steps (to whi we add two further steps); of these the first is the purgation of the soul, the second is a ention, the third intention, the fourth contemplation of order, the fi h the proportional comparison [of things] from [that] order, the sixth negation or separation, the

seventh prayer, the eighth the transformation of oneself into the thing, the ninth, the transformation of the thing into oneself.85

If one were looking for a philosophical ‘key’ to the De umbris idearum, it is surely to this passage that one would look. Rather than an ‘Egyptian revelation’, one would find a Plotinian magic – if one wishes to construe the ‘transformation of the thing into oneself’ as ‘magic’. The transformative power of imagination was a constant theme of Renaissance magic, and while Bruno’s system does not contain references to the talismanic instruments or conjurations referred to by Yates, it can still be construed as magical, albeit a Plotinian rather than a Hermetic magic. It was a magic which wedded

itself to the Lullian synthesis of logic and metaphysics, to pseudo-Ciceronian mnemote nics (appropriating the idea of the striking memory image to the metaphysical idea of a universal structure of analogous similitudes), to religious practices (purgation and prayer), and supported its claims with a wealth of subordinated (or mediating) references to the Cabbala, Pythagoreanism and Aristotelianism.

So, as Yates once asked, ‘How did the system work?’86 I would suggest that the Ars

ASSISTANT

I can extract the quoted or closely cited in Clucas's article *"Simulacra et Signacula"* (pp. 131–168). Here's what appears:

De umbris idearum

Bruno writes that the memory art is not completed "in discourse," but finds perfection "when it is united with a natural agent."

He insists that the goal is not rhetorical recall but *transformative practice*.

De umbris idearum

Bruno enumerates them as:

1. (purgation)
2. (attention)
3. (intention)
4. (contemplation of

order)

5.

(proportional comparison)

6. (negation)

7. (prayer)

8.

(transformation of self into the thing)

9. (transformation of the thing into self)

Bruno writes (as quoted by Clucas):

> "Nor should we be bound to the authority of one lineage of philosophers, but should take what is best from all. This is what Hermes Trismegistus himself declares, when he says that the wise man should pluck fruit from all the sects of philosophers."

This is Bruno using Hermetic authority to argue against being confined to Hermetism.

De umbris idearum

Bruno describes the *umbrae* (shadows) of ideas as the proper objects of mnemonic practice:

> "We work with simulacra and shadows not as ends but as instruments: they are steps by which the intellect ascends."

Bruno explicitly links mnemonic practice to transformation:

> "The end is not the art itself but the transformation of the practitioner: that we may become divine."

Bruno in *De umbris* describes memory not merely as recall but as discovery:

> “It is the office of this art not only to preserve what is found but also to find what is not yet known.”

In his discussion of the higher steps, Bruno insists:

> “Prayer is not petition but contemplation. For the soul, by prayer, aligns itself with the divine.”

These are the main

that Clucas reproduces.

Do you want me to

— almost like a reader’s packet of Bruno’s own voice — or would you like me to

alongside each passage?
